(a) Input

PASSAGE

Spillways are constructed to evacuate the flood discharge safely not to let the flood wave overtop the dam body. There are different types of spillways, ogee type being the conventional one. Stepped spillway is an example of nonconventional spillways. The turbulent flow over stepped spillway was studied numerically by using the Flow-3D package. Different fluid flow characteristics such

selected token: “ such”

(b) AV explanation

FVE 0.801

Academic / technical paper on hydraulic structures, establishing Japanese engineering context for chute spillway design of stepped spillways in mountainous regions. The sentence " The flow characteristics of a stepped spillway are studied for a supercritical flow. " sets up a specific numerical or physical parameter describing the water flow condition, likely a Froude number or flow depth value. Final token ". " closes a clause fragment " for a supercritical flow of height.. " — a measurement or range value (e. g., " height of X meters " or " flow angle ") must immediately follow to complete the noun phrase " the first drop of water over a chute spillway. " Example: " flow rate " or " hydraulic jump height " like " 1. 0 " or " over a low weir " </p>

(c) Sonnet explanation

grounded confabulated

Academic / technical paper introduction establishing context for a CFD study of stepped spillways using Flow - 3D software. List enumeration begun with " fluid flow characteristics such " signals specific hydraulic parameters are about to be named (e. g., velocity, pressure, energy dissipation, aeration). The final word " such " begins a " such as " construction, requiring an immediate list of specific flow characteristics like velocity profiles, pressure distribution, or turbulent kinetic energy.
